CRYOFLOW — PIPELINE SNAPSHOT

Main

Project β-Galactosidase Tutorial (demo) · single-particle · pipeline snapshot

Oct 30, 2026
16 jobs · 4 edges
7 completed · 4 failed · 5 idle

RECEIPT LEDGER — 16 JOBS, THE FULL SENTENCES THE MAP'S CARDS COULD NOT HOLD

Import Movies 1 — Import Movies / Micrographs / Particles — 6 movies imported from Cluster · headers (3 sampled): single-section MRCs 64×64 (mode 1) — motion-corrected micrographs, CTF-ready · Node type says Movies but the sampled headers say single-section (already motion-corrected) — CTF can consume these directly; MotionCorr would refuse them — paths stay on the cluster (zero upload) · pixel 1.77 Å

Motion Correction 1 — Motion Correction — motion corrected, 6 micrographs — 6 image file(s) stayed on the cluster — motioncorr jobs sync metadata only under the key-files policy (STAR, logs and plots come home; image stacks never do, whatever their size). They are listed in this job's Results — open or download one to fetch it on demand — or switch the connection's sync policy to "everything" to bring them home

CTF Estimation 1 — CTF Estimation — CTF estimated for 6 micrographs

Remote Ledger Door (t963) — Motion Correction — motion corrected, 650 micrographs — 650 image file(s) stayed on the cluster — motioncorr jobs sync metadata only under the key-files policy (STAR, logs and plots come home; image stacks never do, whatever their size). They are listed in this job's Results — open or download one to fetch it on demand — or switch the connection's sync policy to "everything" to bring them home

Peek Stress Bench (t966) — Motion Correction — RELION motioncorr finished (the t966 peek-stress bench): 2100 micrographs motion corrected — the workdir carries a wide STAR table and a long pipeline log so the Files tab's peek doors have real stress to ride at the fold

Failed Diagnosis Face (t970) — Motion Correction — motioncor2 exited 137 — CUDA error: out of memory on GPU 0; the CPU retry was killed by the kernel's OOM killer (the t970 failed diagnosis face)

Idle Shape Face (t987) — Import Movies / Micrographs / Particles — Idle

Continue Face (t988) — 3D Auto-Refine — Idle

Rounds Face (t989) — 3D Auto-Refine — Idle

Custom Error Face (t995) — 3D Classification — the wrapper died before RELION started — the modulefile named a RELION build the node no longer has (bash answered 'command not found', the step exited 127); the signature table answered ZERO — the teaser's negative leg re-homed (no known signature, the cause is custom to this job, the log is the truth)

Negative Diagnosis Face (t972) — 3D Classification — relion_refine_mpi was cancelled by the partition's 24-hour walltime (SLURM: DUE TO TIME LIMIT) mid-iteration 7 of 25 — the log carries no error signature by design (the t972 negative diagnosis face)

Cancelled Diagnosis Face (t976) — 3D Classification — the run ended in an external cancellation SLURM recorded in its own words (*** CANCELLED AT … *** — an operator scancel or a preemption; no reason named) mid-iteration 4 of 25 — the strip speaks the t994 scheduler-cancelled row (the face flipped from the teaser's zero to the one-match contract)

2D Classification 1 (t978) — 2D Classification — 2D classification completed: 1200 particles into 4 classes over 2 iterations (the t978 select-rider world's class2d face)

3D Classification 1 (t978) — 3D Classification — 3D classification completed: 1200 particles into 3 classes over 2 iterations (the t978 select-rider world's class3d face)

Classes Consumer (t978) — 2D Class Selection — Idle

Particles Consumer (t978) — 2D Class Selection — Idle
